What is **baio**bit

A combination of technology and services to support the therapist for accurate clinical and functional evaluations, with instant reports to allow objective monitoring of patient progress.

baio**bit** is the result of the research and development of BTS Bioengineering which has been a leader in motion analysis technology for over 30 years.

A digital assistant always by your side, baio**bit** guides the clinician through every step of the rehabilitation process. The sensor transmits all data via Bluetooth to your PC in a user-friendly software interface.

Patient preparation is quick and easy. In just 15 seconds you are ready to start the examination using the baio**bit** wrist, waist or head straps, allowing complete freedom of movement for the tests and exercises.
